Lesson 3.4 - Solving First-Degree Equations Involving Multiple Steps – Part 1

When the left side and right side of an equation are completely simplified, then the equation is ready to be solved. Using two operations is necessary to solve a multi-step equation. To solve the equation, we must make use of the order of operations (PEMDAS). However, when solving the equation we complete any addition/subtraction, first, then multiplication/division.

Class Notes – Solve each first-degree equation and check. If you do not solve an equation, explain why.

| equation, explain why. | | | |
|------------------------|------------------------|----------------------------|--|
| Set 1 | 5x - 6 = 9 | 4m = 10 = 26 | |
| 3x + 2 = 8 | | | |
| | | | |
| | | | |
| | | | |
